

Experts will often ask these questions that are directly related to machine learning concepts. These questions are a good way to be sure you are prepared to continue through the ML journey.

Does using ML succeed in accomplishing my task?

If you do not build the correct model, you will be unable to provide a solution to customers.

How does the ML system work together with those who use the decisions from the model?

This is important because it may highlight some process that was missed when building the ML system. Knowing how the model is used is just as important as building the model itself.

What kind of solution are we actually looking for?

Depending on if you are interested in understanding the data through insights, or answering a fundamental question, this question will guide you into how to design your model.

Does ML really will answer the problem that needs to be solved?

If not, there may be another solution that will be easier and more efficient.
