

In this video, we previewed the final project for you. In this project you'll:

- Stage data and perform ETL (extract, transform, and load) step
- Train and deploy a model
- Configure your model for monitoring
- Integrate your deployed model into a series of Lambda functions
- Deploy a Step Function that orchestrates your functions
- Visualize the events captured by Model Monitor

In the end, you'll be ready to deploy and monitor an ML workflow with SageMaker, Lambda, and Step Functions.
