In this video, we covered three key considerations when we think about whether to use MLE.

- Production-grade ML systems
- Controls and visibility for operators
- Scale - can we get humans out of the loop?

New Terms

- **Production:** the version of our system that we use "for real" i.e. when we present ourselves to users or perform our business function.
- **Scale:** (in the context of software and AI infrastructure) to decouple the amount of staff devoted to building and running a system from the amount of traffic, users, volume, or data that it can support.
